

Business Intelligence in Access Control

BUSINESS INTELLIGENCE IN ACCESS CONTROL

Our Belief

Locken, a subsidiary of the SAR Technologies International Group was born from a conviction that the security requirements of companies should be integrated with their other objectives and that access control intelligence should be rapid and flexible in order to directly help the increase of productivity and profitability.

As a result of this belief, Locken has based its development on two principles since 2003, products and services.

Our Expertise

Every Locken engineer is a specialist in access control and IT. They will assist you not only in assessing and analysing your requirements and solution implementation, but also in the management and development of your system.

The engineers use the strengths of a new and efficient access control solution, which combines management software, smart keys and electronics cylinders.

Their product knowledge and service expertise allows customers to benefit from:

- Very simple use and deployment of the system
- Security and flexibility
- Full access control and audit trail
- Improved productivity and profitability

International

Founded in France, Locken has quickly grown across Europe from Portugal to Denmark; Germany to Romania, our company is active all over the continent thanks to multi-disciplinary teams based in our head office and in different subsidiaries in Spain, United Kingdom and Italy.

Since 2008, a new subsidiary has been created in Mexico, which allows us to develop the Central and South American markets.

More Than 60,000 Sites...

Telecoms operators, international airports, bank groups, national electricity or water distribution companies...

Locken's experience, expertise and resilience are used by prestigious and demanding global companies to improve their security and performance through management of their access control requirements. More than 60,000 sites, all over Europe, are already equipped and/or managed by Locken.

BUSINESS INTELLIGENCE IN ACCESS CONTROL

Why is our approach original and efficient? Due to the combination of its engineering expertise, experience and the performance of its auditable wireless access control solution

Engineering

What is the Locken approach?
Who is allowed to enter our facilities?
Where and when are they allowed to enter?
How do we know who entered and when?
Why has access been denied?
How much could we save by optimising internal resources?

For each client, Locken sales and technical managers analyse and integrate the objectives and constraints to develop a dedicated customised solution.

Our unique expertise allows maintenance and application development, or outsourced management of your access logistics, in order that you benefit from improved efficiency in your daily use of the system. The Locken application can be customised with clients IT systems including workflow integration and interface development.

Access Control

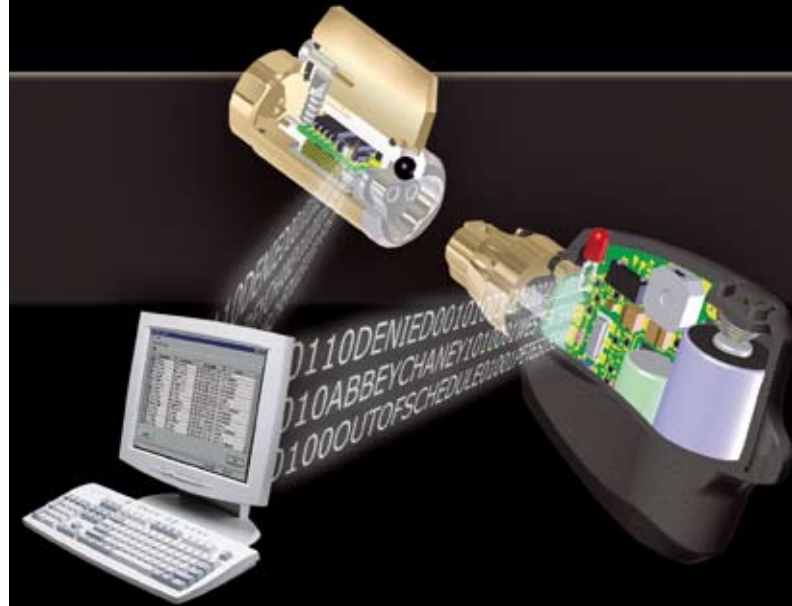

Locken provides an innovative wireless access control solution. This solution offers simplicity and speed of implementation that is unrivalled and comprises:

- Smart keys: containing an electronic chip with memory, every key is unique, cannot be duplicated and contains all the access codes, whatever the lock type. Access codes can be updated in real-time, via a computer or a mobile phone. If a key is lost, the access codes are simply deactivated.

- Electronic cylinders: for doors, padlocks, cabinets and other specific locks. All of our 200 plus cylinders can be installed without any expensive hard wiring or power. They have no keyway so cannot be picked and high security LPCB 4 compatible cylinders are also available.
- Management software: allowing you to programme locks and keys, to record events and analyse time and attendance. Locken also has the unique ability to interface the software with your own information systems.

In summary the Locken Solution offers you flexibility, efficiency and profitability for your business.

TELECOM OPERATORS, BANK NETWORKS, WATER, GAS AND ELECTRIC DISTRIBUTION, AIRPORTS, HOSPITALS, OFFICES...

Beyond security, our solutions offer large and multi-site companies the ability to improve their efficiency and their profitability thanks to a flexible, more advanced access control system.

Telecom Operators

Flexibility and profitability best describe the benefits of the Locken System for mobile network operators.

The aim? Through a better access control system, to allow large numbers of contractors to work at thousands of sites countrywide and to ensure an improved level of service

Locken provides comprehensive project management and employee training. Keys are programmed to optimise the efficiency of access to the sites. Permanent access permissions are created for the technicians delivering breakdown services, while schedules with fixed start and end dates are created for the maintenance engineers. The system management is undertaken by Locken. Who ensures that the operator receives customised, frequent and comprehensive reports on contractors' activities.

Airports and Exhibition Centres

How to install an access control system at low cost that can accommodate a wide range of locking mechanisms?

From the simplicity of its wireless conception, and thanks to the intelligence and power in the key, the deployment of the Locken solution is very fast and cost effective across the site. Using the Locken Web Control software, the updating and management of the access rights is significantly simplified.

Contractors are provided with a unique key with temporary access rights into required areas of the site.

Full reports are provided to management

Electricity, Gas, Water...

Security and auditability: on sensitive classified sites the security has to be at an optimum level, but controlling, identifying and analysing movement of people is important too.

Locken's engineers provide a full analysis of the requirements of each site. A customised solution is developed and deployed. Security is enhanced by use of LPCB Level 4 compatible locks and also through the use of time delays and multiple keys being required to access certain locks

The generation of audit trails allows complete control and accountability of external contractor movement. It is coupled with a reporting system in real time providing company management with the necessary information to manage the business better improving security, health and safety and productivity.
